

The Matrix SDK No One Talks About

# About the speaker

**Benedict Benken**

Co-Founder 

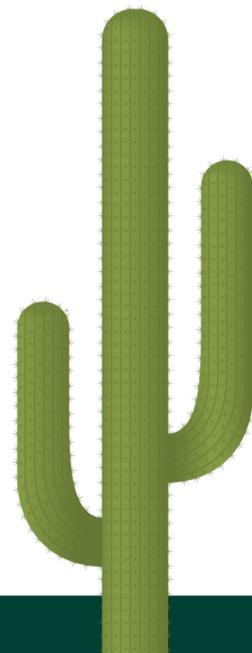

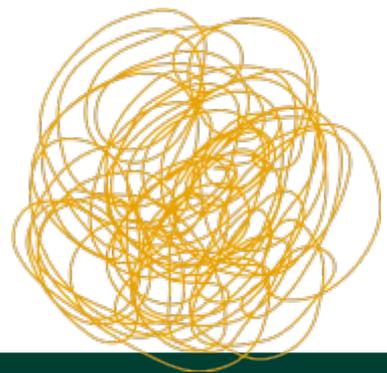

Who knows Trixinity?

# Expectations

- Bug reports
- Feature requests
- Merge requests
- Traffic in help rooms
- Commercial support requests
- Open Source projects using it

# The reality

Who uses Trixinity?

# Expectations ⚡ Reality

-  Bug reports
-  Feature requests
-  Merge requests
-  Traffic in help rooms
-  Commercial support requests
-  Open Source projects using it

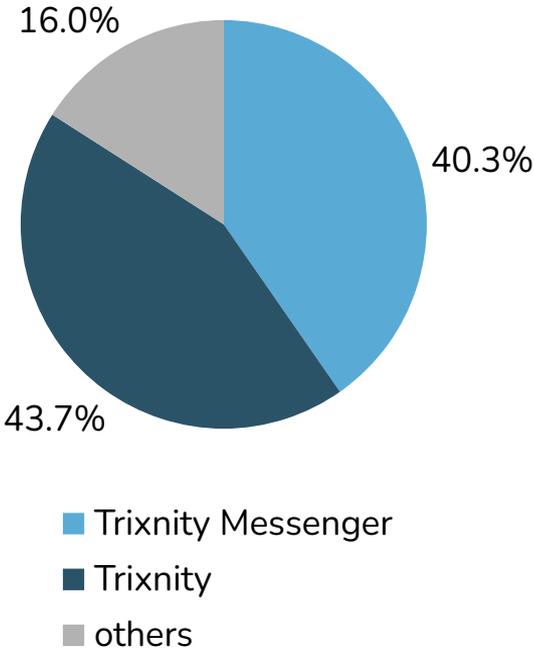

# TI-Messenger - Facts

- Some of the public tenders explicitly asked for Kotlin Multiplatform
- Trixnity is the only Kotlin Multiplatform Matrix SDK
- All public tenders did have an extremely short deadline
- Apache 2 licence requires credit

# TI-Messenger - Result

Usage in TI-Messenger ePA Clients

84%

→ ca. 63 million potential users

Figures as a percentage of those with public health insurance

# Expectations ⚡ Reality

-  Bug reports → High test coverage, less bugs
-  Feature requests → Mostly feature complete
-  Merge requests → Complex project
-  Many traffic in help rooms → Few manufactures
-  Commercial support requests → “Open Source = Cost Free”

Why not Trixinity?

## Reasons against using Trixinity

- Steep leaning curve
  - Flexibility introduces complexity
  - You can shoot yourself in the foot
- “Kotlin is an Android language” or “I don’t like Kotlin”
- Low level API

## Why you should give it a try

- Fast
- Reactive
- Type-Safe
- Extensible
- Use it as part of high level API like Trixinity Messenger
- Kotlin is an awesome language

# Kotlin is an awesome language

- Statically typed programming language
- Multiplatform: JVM, JS, Native and WebAssembly
- Common code base between platforms
- Platform-specific implementations possible
  - Access to platform-specific APIs (Android, iOS, Browser, etc.)
  - Use of platform-specific libraries (Maven, npm, C)
- Allows you to create your own DSLs
- Coroutines and Flows

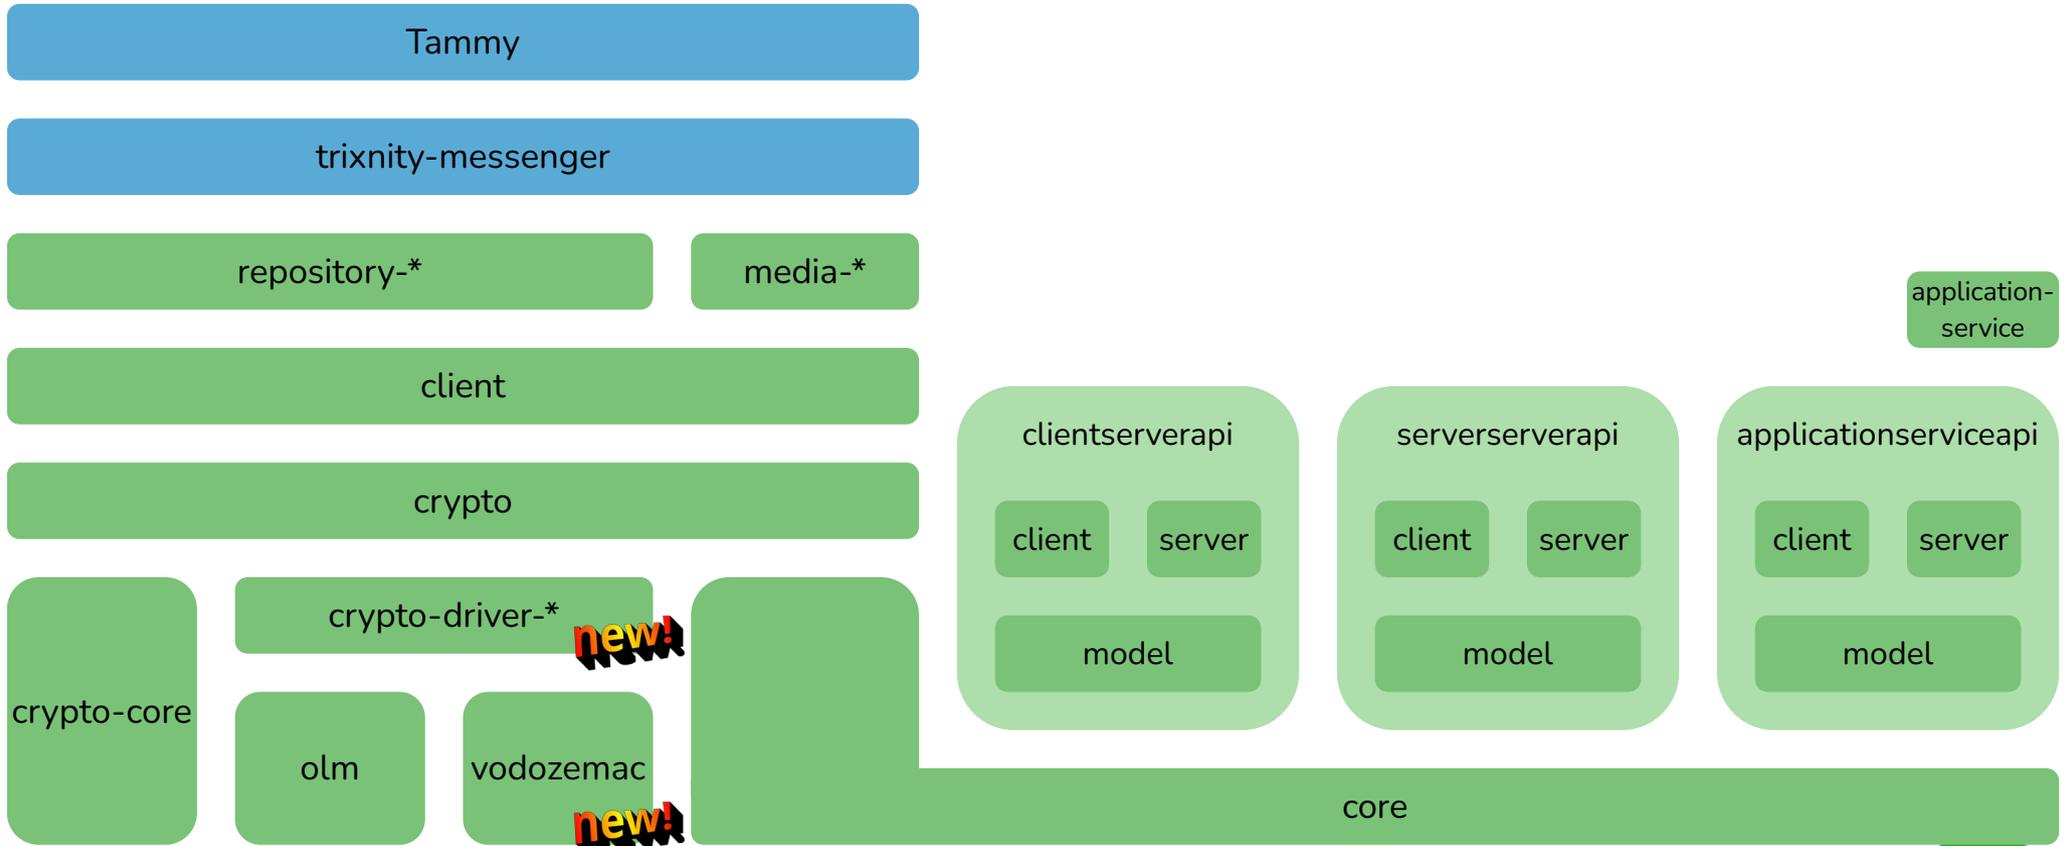

# Agony of Choice

|  | <b>matrix-rust-sdk</b>                                  | <b>matrix-dart-sdk</b>                 | <b>Trixinity</b>  |
|--|---|--|---|
| <b>Licence</b>                             | Apache-2  | AGPL-3                                 | Apache-2  |
| <b>Language</b>                            | Rust  | Dart                                   | Kotlin  |
| <b>Targets</b>                             | Native  | Native, JS, WASM                       | JVM, JS, Native, WASM (planned)   |
| <b>Bindings</b>                            | Kotlin, Swift, Python, Ruby                             | -                                      | Possible, but not implemented yet   |
| <b>Extensibility</b>                       | Type safe custom events                                 | custom events via JSON                 | Type safe custom events, DI   |
| <b>Reactivity</b>                          | Many as Observables                                     | Some as Streams (usually onSync)       | Everything as Flow  |
| <b>Local database/<br/>offline support</b> | Exchangeable (e. g. SQLite, IndexedDB), except Timeline | Exchangeable (e. g. SQLite, IndexedDB) | Exchangeable (e. g. SQL, IndexedDB, Realm), with reactive in-memory-cache |
| <b>Media</b>                               | Exchangeable media store, streamable                    | Not streamable                         | Exchangeable media store (e. g. filesystem, OPFS), streamable             |
| <b>UI helpers</b>                          | Room list, Timeline, Sync                               | -                                      | High level view models in trixinity-messenger (AGPL-3)                    |

# What's next?

- OAuth2 based authentication
- Reworked notifications
  - Get updates from replacements or redactions
  - Get correct notification count
  - Sync notifications to system
- WebAssembly
- Matrix 1.14+
- Vodozamac support

# Architecture

Try it out and contribute!
